SECURITY & CRYPTOGRAPHY

KOURAN Continuation Token Execution Model

Execution is driven by continuation tokens rather than SKYRA hyperblocks; a continuation becomes eligible when dependency tokens, authority state and expected object version satisfy the architectural contract.

IP-3632 · Source / reference evidence · RTL / reference evaluation

Function and architecture

• Execution is driven by continuation tokens rather than SKYRA hyperblocks

• a continuation becomes eligible when dependency tokens, authority state and expected object version satisfy the architectural contract

Integration summary

KOURAN Continuation Token Execution Model provides the documented execution architecture responsibility: Execution is driven by continuation tokens rather than SKYRA hyperblocks; a continuation becomes eligible when dependency tokens, authority state and expected object version satisfy the architectural contract. Evaluate the exact KOURAN-IP-002 implementation and confirm its integration contract before using it inside the target design.

Technical record

Canonical identity	IP-3632
Native implementation identity	KOURAN-IP-002
Documented responsibility	Execution is driven by continuation tokens rather than SKYRA hyperblocks; a continuation becomes eligible when dependency tokens, authority state and expected object version satisfy the architectural contract.
Recorded evidence class	Source / reference evidence
Interface and physical parameters	Bound to the selected source/configuration; not inferred from name or family.

Delivery and release binding

• Exact implementation and configuration manifest

• Documented interfaces and clock/reset contract

• Available reference or verification collateral

• Recorded physical views where authorized and applicable

• Integration acceptance criteria and unresolved gate list

Confirm for the selected release: Source/configuration identity, Interface and dependencies, Verification evidence, Process/library where applicable, Authorized package and acceptance criteria.

Evidence and qualification

Architecture docs + continuation queue/token-table RTL + compiler token-format source.

Evidence shown is our record for this canonical implementation, not a fresh tool rerun. External foundry acceptance, silicon measurements, standards certification and unlisted interface/physical parameters are not inferred. Exact delivery and rights are agreed before licensing.

Canonical status: P1 / IMPLEMENTATION-BACKED ARCHITECTURE; FULL ELIGIBILITY GATE NOT YET INTEGRATED

Evaluation and licensing

Evaluation: Review the exact recorded implementation and agreed test scope. Production: Named-design rights for the agreed qualified release. Custom work: Target integration, verification or physical qualification. Rights, pricing, support and acceptance criteria are agreed for the exact scope.
