SECURITY & CRYPTOGRAPHY

LAKOU Effect Ledger Atomic Commit Architecture

Accumulates externally visible side effects in a ledger and discards them on fault, authority failure, version conflict or abort, enabling precise recovery without whole-graph rollback.

IP-3826 · Source / reference evidence · RTL / reference evaluation

Function and architecture

• Accumulates externally visible side effects in a ledger and discards them on fault, authority failure, version conflict or abort, enabling precise recovery without whole-graph rollback.

Integration summary

LAKOU Effect Ledger Atomic Commit Architecture provides the documented precise-state / recovery architecture responsibility: Accumulates externally visible side effects in a ledger and discards them on fault, authority failure, version conflict or abort, enabling precise recovery without whole-graph rollback. Evaluate the exact LAKOU-IP-008 implementation and confirm its integration contract before using it inside the target design.

Technical record

Canonical identity	IP-3826
Native implementation identity	LAKOU-IP-008
Documented responsibility	Accumulates externally visible side effects in a ledger and discards them on fault, authority failure, version conflict or abort, enabling precise recovery without whole-graph rollback.
Recorded evidence class	Source / reference evidence
Interface and physical parameters	Bound to the selected source/configuration; not inferred from name or family.

Delivery and release binding

• Exact implementation and configuration manifest

• Documented interfaces and clock/reset contract

• Available reference or verification collateral

• Recorded physical views where authorized and applicable

• Integration acceptance criteria and unresolved gate list

Confirm for the selected release: Source/configuration identity, Interface and dependencies, Verification evidence, Process/library where applicable, Authorized package and acceptance criteria.

Evidence and qualification

Evidence retained in our records

Evidence shown is our record for this canonical implementation, not a fresh tool rerun. External foundry acceptance, silicon measurements, standards certification and unlisted interface/physical parameters are not inferred. Exact delivery and rights are agreed before licensing.

Canonical status: P1 / IMPLEMENTATION-BACKED; 5,000 FAULT ROLLBACKS WITH 0 VISIBLE WRITES

Evaluation and licensing

Evaluation: Review the exact recorded implementation and agreed test scope. Production: Named-design rights for the agreed qualified release. Custom work: Target integration, verification or physical qualification. Rights, pricing, support and acceptance criteria are agreed for the exact scope.
